

# Lettuce Dataset Analysis

Prateek Singh/ 10<sup>st</sup> June 2025

# Agenda

# Introduction I

- The [Lettuce dataset](#) offers a unique perspective into the life cycle of a Lettuce plant.
- The project aims to investigate the relationship between the temperature, humidity, TDS value, pH level as the plant progress throughout its life and how they effect the plant growth.
- The project also aims to calculate the statistical summary such as mean, median, quartiles, min/max for each variables to gain insights into the distribution of the data.
- The dataset consists of the following variables:
  - Plant\_Id: A distinctive identifier assigned to each individual plant.
  - Date: The timestamp of the observation, marking key milestones in the growth process.
  - Temperature(°C): The recorded temperature in degree Celsius, a crucial environmental variable.
  - Humidity(%): The percentage representing the humidity level, influencing the plant's water uptake.
  - Total Dissolved Solvents(TDS)(ppm): A measurement of dissolved solids in parts per million, reflecting nutrient availability.
  - pH level: The environmental pH level, another crucial factor impacting nutrient absorption.
  - Growth Days: The duration, in days, from the initial growth stage to the plant's full maturity.
- The dataset was made available under the Apache 2.0 licence.

# Introduction II

Plant_ID	Date	Temperature (°C)	Humidity (%)	TDS Value (ppm)	pH Level	Growth Days
1	8/3/2023	33.4	53	582	6.4	1
1	8/4/2023	33.5	53	451	6.1	2
1	8/5/2023	33.4	59	678	6.4	3
1	8/6/2023	33.4	68	420	6.4	4
1	8/7/2023	33.4	74	637	6.5	5
1	8/8/2023	32.3	77	478	6.8	6
1	8/9/2023	32.3	75	682	6	7
1	8/10/2023	22.7	63	576	6.3	8
1	8/11/2023	31.9	69	662	6.1	9
1	8/12/2023	30.2	59	607	6.2	10
1	8/13/2023	30.1	77	670	6.5	11
1	8/14/2023	30.1	54	535	6.4	12
1	8/15/2023	30.1	78	480	6	13
1	8/16/2023	29.8	56	688	6.4	14
1	8/17/2023	29.6	62	653	6.6	15

# Data Cleaning and Manipulation

- The date column had some dates as text format and some in the date format. So, there was no direct method to make them consistent.
- First replaced all the delimiters present in the date column to '-' from '/'. So that it can be divided into multiple columns, using the text to column option.
- Then used the `DATE()` function to concatenate the years, month, and date to make the dates in a consistent format.
- Converted the column types of *Plant\_Id*, *TDS\_Value*, *Humidity*, *pH\_Level* and *Growth\_Days* from General to Number, also changed the column type of *Temperature* from General to Temperature.
- Under extensive inspection of the dataset we observe some incoherent values for the *Plant\_Id* greater than 50; hence we decided to exclude those values for accurate analysis.
- Using the Z-Score Test, I was able to find out the outliers in the dataset and removed them, hence increasing the accuracy of the analysis.

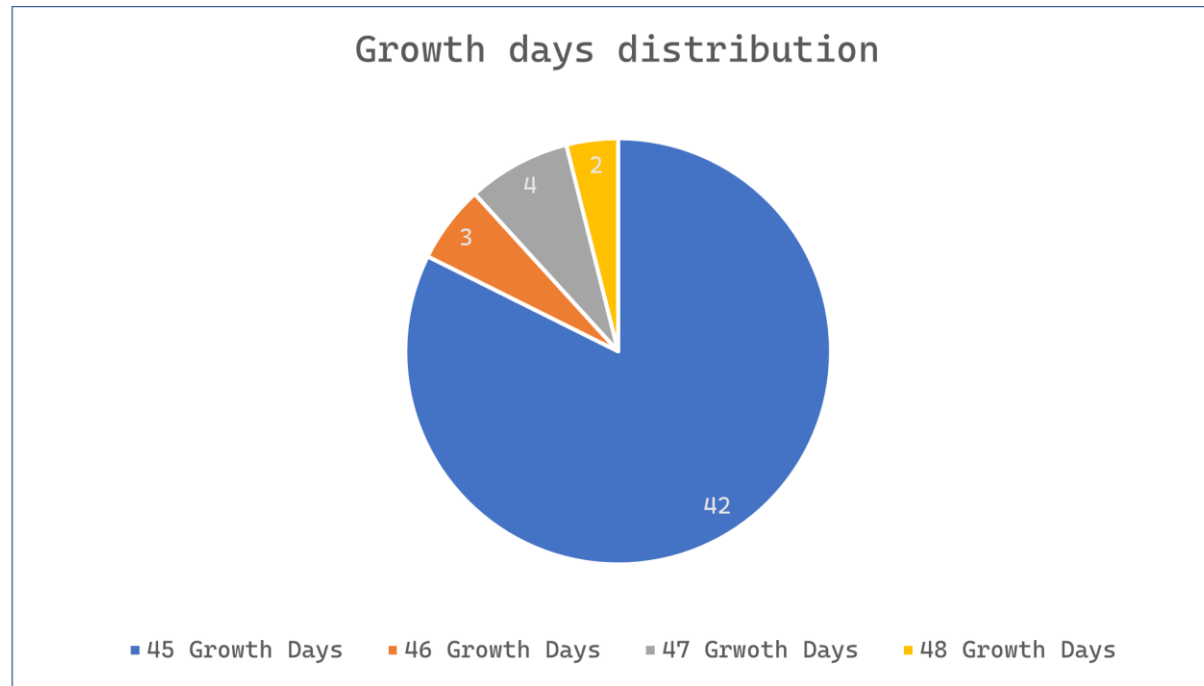

# Summary of the Analysis

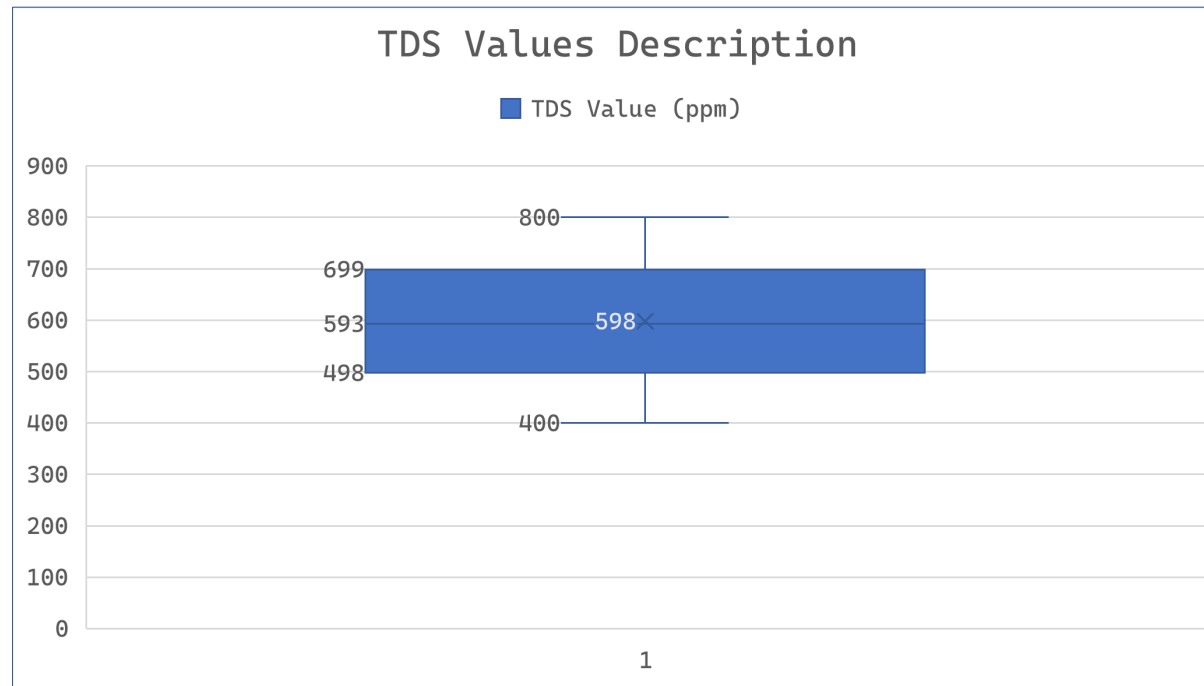

- For the project, 70 randomly selected Lettuce plants were taken into consideration; which had an average growth day of 45.25 days.
- The maximum growth days was 48 days, while the minimum growth days for plant was 45 days, for the plants present in the dataset.
- The pH of the soil remains between 6.3 and 6.4 throughout the Lettuce plant's life cycle. Though we see a sudden drop in the pH after day 46, where it reaches the value 6.2.
- We see no general trend in the humidity of the environment with respect to the growth days, but it generally stays stable in the range of 60s%.
- The temperature during the Growth Days, in the life cycle of the plant, usually stays stable about 28°C, with severe drop on day 8 and day 38 where it reaches 22° and 20°C respectively.
- The TDS displayed a relatively stable profile, fluctuating within the range 580 to 620 ppm. However, a significant deviation was recorded on the day 33 and 48.
